

IMSI Low Tech Movement Exploration: *choose your own adventure*

Low Tech Example: 1 fixed camera (cell phone), side view

Tasks: sit-to-stand, overhead squat, vertical jump, hop, jump rope, hopscotch challenge...

Camera cup holder for cell phone:

1. Cut cup across rim, creating vertical slits = thickness of your cell phone for snug fit.

2. Add some weight to the bottom of the cup for stability (e.g., adding sand, rocks in the cup lowers the center of mass of cup-camera system)

3. Place camera in the slits of the cup and verify camera is recording video (120 fps)

- Phone position in cup is for landscape recording (see picture)
- Phone upright, aligned with gravity (vertical)
- Phone aligned with the direction of movement with camera up top

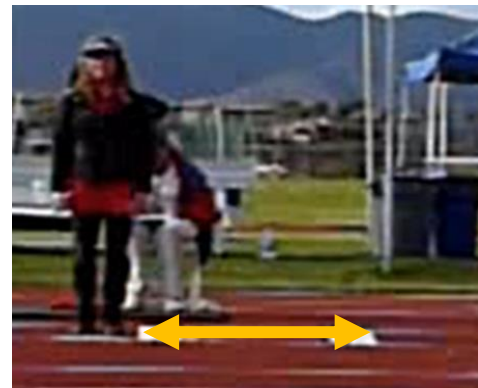

4. Verify that you can see the entire movement of interest (e.g., whole body hopping, basketball player and trajectory of the ball from hands to rim, squat (feet and hands over head), vertical jump (feet and hands at top of the jump))

5. Mark 1 meter in length in the plane of movement with objects that contrast with ground (e.g., see white marks 1 meter apart in middle of lane or person height = 5'0")

6. Push start video record and then complete the movement (e.g. side view of overhead squat). Stop recording and note task and intention in log sheet (e.g., hop at preferred frequency)

7. For a front view, Turn body 90 degrees and repeat the movement (e.g., hop at preferred frequency)

8. Before uploading to google drive

- edit video by cropping the video to the interval of interest
- pulling out ends of recording so time between images is 1/120s for all images

9. Rename file in google folder with naming convention (date: 250607, participant initials (JiMc) task code (HopPF) 120 frames per second, original video number (e.g., TC10008) **250607JiMcHopPF120008**
